

Colour management by a change of the *rgb* data within the colour workflow before the linearized output

See ISO-Ergonomics of human-systems interaction – Field assessment methods for electronic visual displays

For ISO-test charts according to ISO 9241-306:2018 see: <http://standards.iso.org/iso/9241/306/ed-2/index.html>

The computer with an **Ergonomic Colour Processor (ECP) includes the 1MinusRelations (1MR)**. It is valid:

$r=1-c$, $g=1-m$, $b=1-y$. [1]. The output is equal for: $r=g=b=0,5$ or $c=m=y=0,5$ or $k=0,5$ or $w=1-k=0,5$. [2]

If the 1MR is active, then the output of the ISO-test chart shows **equal output** in each colour square of:

<http://standards.iso.org/iso/9241/306/ed-2/AE49/AE490-7N.PDF> and independent of the use of *rgb* or *cmyk*.

¹⁾ For an example see the printed english version of <http://standards.iso.org/iso/9241/306/ed-2/ES15.PDF>

This offset print includes the start and linearized output of many analog ISO-test charts of ISO 9241-306.

In a general case the Software Image Processor (RIP) transfers 16,7 (256x256x256–1) million *rgb* to *rgb'* data.

The appropriate fixed transfer U shall fill the CIELAB colour triangle: $W - N -$ maximal colour – W .

For any maximal colour it is valid: $k=0$. One of the 3 values **cmy0** or **rgb** has the value 1 and one other the value 0.

For linearization methods see *Klaus Richter (2016), 1,4 MB, http://farbe.li.tu-berlin.de/OUTLIN16_01.PDF*
