

Weber-Fechner law in CIE 230:2015 for threshold colour difference of surface colours
The Weber-Fechner law describes the lightness L^* as logarithmic function of L . The Stevens law describes the lightness L^* as potential function of L .
BET 1992: 2 uses a similar potential function $L^*_{BET} = 50 + 10 \cdot L^{0.4}$.
The Weber-Fechner law is equivalent to the equation: $\Delta L^* = c \cdot L$.
Integration leads to the logarithmic equation: $L^* = 40 \log(L) + 50$.
Differentiation leads for $\Delta L^* = 1$ leads to the linear equation: $L = 10^{(\Delta L^* - 50)/40}$.
For the values in the standard contrast range is 25:1-90:3.6.
Table 1: CIE relative values L^* , luminance L , and lightness L^* .

Colour (name)	Tristimulus value	Relative luminance	CIE lightness	Relative lightness
(contrast) (25:1-90:3.6)	L	L	L^*	L^*
White W (ach)	100	1.0	100	1.0
Black N (ach)	0.0001	0.0001	0	0
Grey Z (ach)	18	0.18	1	0.01
Black N (ach)	0.0001	0.0001	0	0
Black N (ach)	0.0001	0.0001	0	0

For the luminance range between $L^* = 0$ and 100 the constant is $k = 40 \log(100/50) = 57.57$.
