1) The example shows data for data projectors (P). The standard contrast step (bold) with  $L_{WP}=142*36 cd/m^2$  is hard to reach.

2) 500 lux corresponds to the viewing luminance  $L_v=142 cd/m^2$  for the standard offset paper (S) with the tristimulus value  $Y_W=88,9$ .

3) For the contrast  $C_Y=2:1$  the viewing luminances of both the black in the projection and the white standard offset paper are equal (!). Visual fatigue caused by the adaptation luminance ratio 36:1 of the black at the screen and the black at the paper shall be reduced.

If for example a grey screen with the CIE tristimulus value  $Y_Z = 22,2 (=0,25*88,9)$  is used the contrast step  $C_{Y_i}$  remains constant.

Then the luminance ratio of all colours at the screen and the paper has reduced to 9:1. This reduces visual fatigue.
