$C_{Y6} 72:1$	88,9 : 1,25	0,93 ... <1,87	$G_{P2} = 2,04$	$G_{P2} = 0,850$	display, only 250 lux	
$C_{Y5} 36:1$	88,9 : 2,50	1,87 ... <3,75	$G_{P3} = 1,86$	$G_{P3} = 0,775$	display & surface	
$C_{Y4} 18:1$	88,9 : 5,00	3,75 ... <7,50	$G_{P4} = 1,68$	$G_{P4} = 0,700$	display & surface	
$C_{Y3} 9:1$	88,9 : 10,0	7,50 ... <15,0	$G_{P5} = 1,50$	$G_{P5} = 0,625$	display & surface

1) The example is intended for data projectors (P) with $G_{P0}=2,4$. Compare IEC 61966-2-1: $G_{P0}=2,4$.

2) The computer operating system Apple has used the value 1,8 until 2010. The change to 2,4 (= Windows) is in the wrong direction.

3) For the contrast $C_{Yi} > 2:1$ the viewing luminances of both the black in the projection and the white standard offset paper are equal (!).

Visual fatigue caused by the adaptation luminance ratio 36/1 of the black at the screen and the black at the paper shall be reduced.

If for example a grey screen with the CIE tristimulus value $Y_L = 22,2 (=0,25*88,9)$ is used the contrast step C_{Yi} remains constant.

Then the luminance ratio of all colours at the screen and the paper has reduced to 9:1. This reduces visual fatigue.

1) The example is intended for data projectors (P). The standard contrast step (bold) with $L_{WP}=142*36 \text{ cd/m}^2$ is hard to reach.

2) 500 lux corresponds to the viewing luminance $L_{ws}=142 \text{ cd/m}^2$ for a standard white paper with the tristimulus value $Y_w=88,9$.

3) For the contrast $C_{Vi} > 2:1$ the viewing luminances of both the black in the projection and the white standard offset paper are equal (!).

1) The example is intended for data projectors (P). The standard contrast step (bold) with $L_{WP}=36*36 \text{ cd/m}^2$ is hard to reach.
