1) The example is intended for data projectors (P) with $G_{P0}=2,4$. Compare IEC 61966-2-1: $G_{P0}=2,4$.
2) The computer operating system Apple has used the value 1,8 until 2010. The change to 2,4 (= Windows) is in the wrong direction.
3) For the contrast $C_{Y1} \geq 2$ the viewing luminances of both the black in the projection and the white standard offset paper are equal (1).
Visual fatigue caused by the adaptation luminance ratio 36:1 of the black at the screen and the black at the paper shall be reduced. If for example a grey screen with the CIE tristimulus value $Y_2 = 22,2$ (<0,25*88,9) is used the contrast step C_{Y1} remains constant.
This the luminance ratio of all colours at the screen and the paper has reduced to 9:1. This reduces visual fatigue.

1) The example is intended for data projectors (P). The standard contrast step (bold) with $L_{WP}=142*36$ cd/m² is hard to reach.
2) 500 lux corresponds to the viewing luminance $L_P=142$ cd/m² for a standard white paper with the tristimulus value $Y_2=88,9$.
3) For the contrast $C_{Y1} \geq 2$ the viewing luminances of both the black in the projection and the white standard offset paper are equal (1).
