- 1) The example is intended for data projectors (P) with $G_{P0}=2.4$. Compare IEC 61966-2-1: $G_{P0}=2.4$.
 2) The computer operating system Apple has used the value 1.8 until 2010. The change to 2.4 (= Windows) is in the wrong direction.
 3) For the contrast $C_{Y1} \rightarrow 2:1$ the viewing luminances of both the black in the projection and the white standard offset paper are equal (!). Visual fatigue caused by the adaptation luminance ratio 36:1 of the black at the screen and the black at the paper shall be reduced. If for example a grey screen with the CIE tristimulus value $Y_2 = 22.2 (=0.25*88.9)$ is used the contrast step C_{Y1} remains constant. Then the luminance ratio of all colours at the screen and the paper has reduced to 9:1. This reduces visual fatigue.

- 1) The example is intended for data projectors (P). The standard contrast step (bold) with $L_{WP}=142^{36} \text{ cd/m}^2$ is hard to reach.
 2) 125 lux corresponds to the viewing luminance $L_{WS}=142 \text{ cd/m}^2$ for a standard white paper with the tristimulus value $Y_{ws}=88.9$.
 3) For the contrast $C_{Y1} \rightarrow 2:1$ the viewing luminances of both the black in the projection and the white standard offset paper are equal (!). Visual fatigue caused by the adaptation luminance ratio 36:1 of the black at the screen and the black at the paper shall be reduced.
