1) The example is intended for data projectors (P). The standard contrast step (bold) with $L_{WP}=142*36 \text{ cd/m}^2$ is hard to reach.

2) 500 lux corresponds to the viewing luminance $L_v=142 \text{ cd/m}^2$ for a standard white paper with the tristimulus value $Y_W=88,9$.

3) For the contrast $C_Y=2:1$ the viewing luminances of both the black in the projection and the white standard offset paper are equal (!).

Visual fatigue caused by the adaptation luminance ratio 36:1 of the black at the screen and the black at the paper shall be reduced.

If for example a grey screen with the CIE tristimulus value $Y_Z = 22,2 (=0,25*88,9)$ is used the contrast step C_{Y_1} remains constant.

Then the luminance ratio of all colours at the screen and the paper has reduced to 9:1. This reduces visual fatigue.
