CIELAB lightness $L^{*}$, CIE tristimulus value discrimination $d Y$ and CIE contrast sensitivity ( $Y / d Y$ )

CIELAB lightness for all colours $L^{*}{ }_{w}=100$ :

$$
L^{*}=116\left(Y / Y_{\mathrm{n}}\right)^{1 / 3}-16 \quad\left(Y_{\mathrm{n}}=100, Y>1\right)
$$

For the grey discrimination we get:

$$
d L^{*} / d Y=\left(116 / Y_{n}\right)(1 / 3)\left(Y / Y_{n}\right)^{-2 / 3}
$$

and for $d L^{*}=1$ (about 3 thresholds) we can write:

$$
d Y=\left(3\left(Y_{\mathrm{n}}^{1 / 3}\right) / 116\right)(Y)^{2 / 3}
$$

or

$$
\log (d Y)=\log \left(3\left(Y_{n}^{1 / 3}\right) / 116\right)+(2 / 3) \log (Y)
$$

therefore in a log-log diagram the slope is $(2 / 3)$.
for the CIE contrast sensitivity, and for $d L^{*}=1$ it is valid:

$$
Y / d Y=(1 / 3)\left(116 /\left(Y_{\mathrm{n}}^{1 / 3}\right)\right) Y^{1 / 3}
$$

or

$$
\log (Y / d Y)=\log \left((1 / 3)\left(116 /\left(Y_{n}^{1 / 3}\right)\right)+(1 / 3) \log (Y)\right.
$$
